

ASSIGNMENT-14.4

Name: G.Mythili

Ht.no:2303A51283

Batch:05

Task 1:Responsive Homepage Layout for aStartup Website

Task Description

- Create a web page structure using HTML that includes:
 - o A header with navigation links
 - o A main content section
 - o A footer with basic information
- Use AI assistance to generate responsive CSS using media queries.
- Ensure the layout adjusts smoothly across different screen sizes

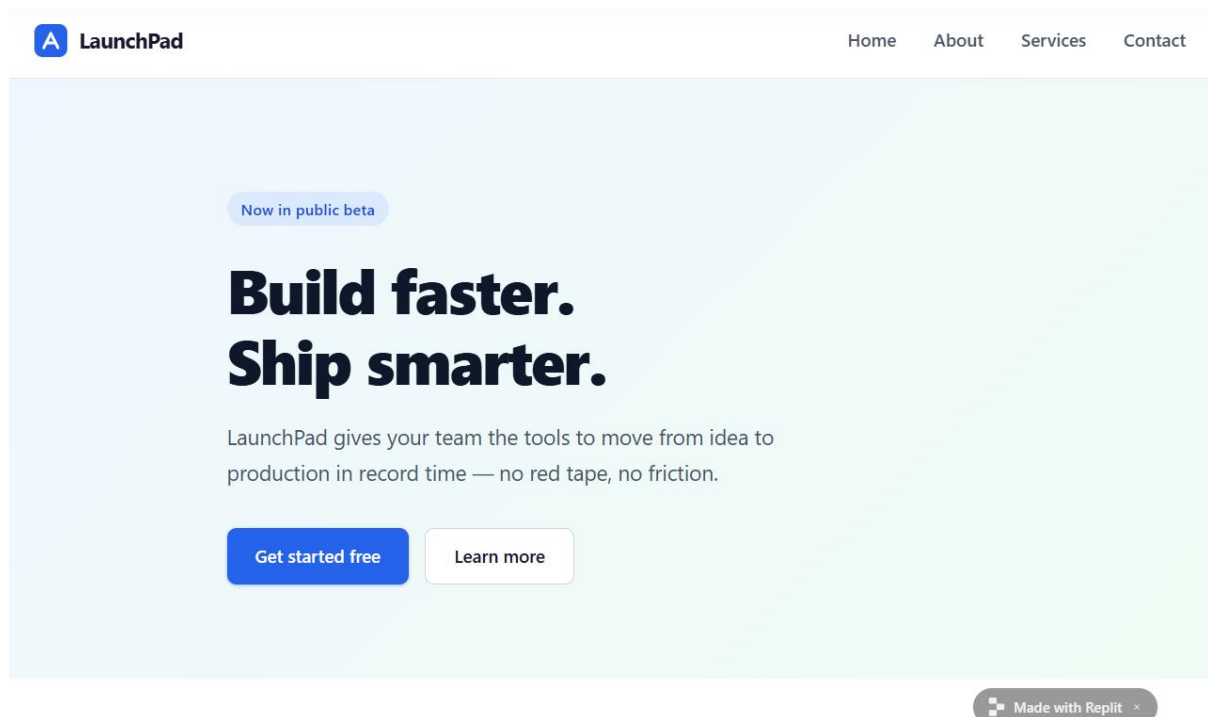

Prompt:

Create a responsive homepage layout for a startup website using HTML and CSS.

Requirements:

1. The page should contain:
 - A header with a logo and navigation links (Home, About, Services, Contact).
 - A main content section with a welcome message and some sample text.
 - A footer with copyright information.
2. Use CSS media queries to make the layout responsive.
3. The layout should adjust for:
 - Desktop screens
 - Tablets
 - Mobile phones
4. On smaller screens, the navigation links should stack vertically.
5. Keep the design simple and clean.

Output:

Explanation:

The webpage uses HTML to create a header, main content, and footer section. CSS is used to style the layout and arrange the navigation links. Media queries are added to make the webpage responsive on mobile, tablet, and desktop screens. This ensures the layout adjusts properly and looks good on all devices.

Task 2: Interactive Call-to-Action Button

Task Description

- Add a button to a web page using HTML.
- Use AI to generate JavaScript that responds to the button click by:
 - o Displaying a message or alert
- Ask AI to add meaningful comments explaining the JavaScript logic.

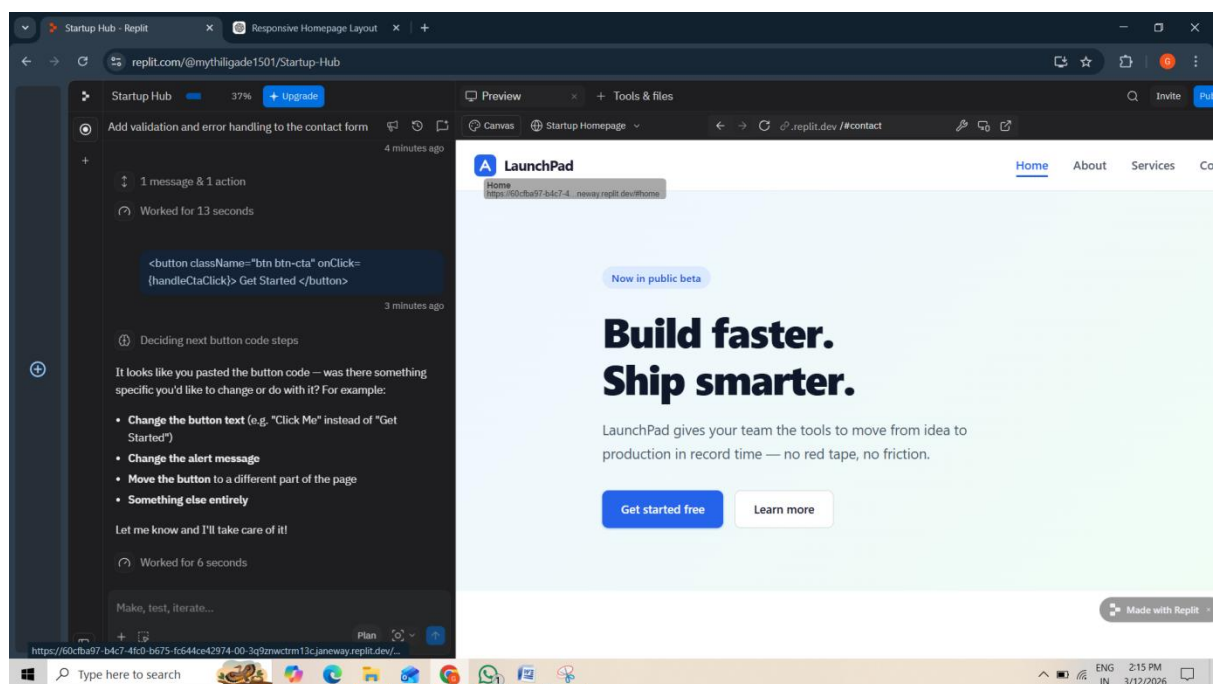

Prompt:

Create a simple web page with an interactive Call-to-Action button using HTML and JavaScript.

Requirements:

1. Add a button on the webpage with the text "Get Started" or "Click Me".
2. Use JavaScript to respond when the button is clicked.
3. When the button is clicked, display an alert message such as "Thank you for clicking the button!".
4. Write the JavaScript code in a simple way.
5. Add meaningful comments in the JavaScript code explaining what each part of the code does.
6. Keep the code clean and easy to understand for beginners.

Output:

Explanation:

A button is added using HTML to create a call-to-action element. JavaScript is used to detect when the button is clicked. When the user

clicks the button, an alert message is displayed on the screen. The action happens instantly without reloading the webpage.

Task 3: Contact Form with Client-Side Validation

Task Description

- Design a form with fields for:
 - o Name
 - o Email
 - o Message
- Use AI to generate JavaScript validation logic that:
 - o Prevents empty submissions
 - o Checks for a valid email format
- Display clear error messages for invalid input.

Prompt:

```
Create a simple contact form using HTML, CSS, and JavaScript.

Requirements:

1. The form should include the following fields:
  • Name
  • Email
  • Message
  • Submit button
2. Use JavaScript to add form validation.
3. The validation should:
  • Prevent the form from being submitted if any field is empty.
  • Check if the email is in a valid email format.
4. If there is an error:
  • Display clear error messages below the input fields.
  • Highlight the invalid fields.
5. If all inputs are valid:
  • Display a success message like "Form submitted successfully".
6. Write the JavaScript in a simple way and include comments explaining the validation logic.
```

Form submitted successfully!

Thanks for reaching out — we'll get back to you within one business day.

Send another message

Explanation:

A contact form is created using HTML with fields for name, email, and message. JavaScript validation checks if the fields are empty and if the email format is correct. If the input is invalid, error messages are

shown near the fields. If all inputs are valid, a success message is displayed without reloading the page.

Task 4: Dynamic List Management for a Product Page

Task Description

- Create a simple HTML list to display items.
- Use AI to generate JavaScript that:
 - o Adds a new item when an “Add” button is clicked
 - o Removes the last item when a “Remove” button is clicked
- Ensure the DOM updates dynamically.

Prompt:

Create a simple web page for a product list using HTML, CSS, and JavaScript.

Requirements:

1. Display a list of items using an HTML unordered list ().
2. Add two buttons:
 - "Add Item"
 - "Remove Item"
3. Use JavaScript to manage the list dynamically.
4. When the "Add Item" button is clicked:
 - A new item should be added to the list.
5. When the "Remove Item" button is clicked:
 - The last item in the list should be removed.
6. The list should update immediately using DOM manipulation.
7. Write the JavaScript code in a simple way and include comments explaining how the DOM is updated.

Output:

OUR PRODUCTS

Dynamic product list

Use the buttons below to add or remove products from the list. The page updates instantly — no reload required.

+ Add Item

– Remove Item

0 items

No items in the list. Click [+ Add Item](#) to add one.

OUR PRODUCTS

Dynamic product list

Use the buttons below to add or remove products from the list. The page updates instantly — no reload required.

+ Add Item

– Remove Item

3 items

Automated Testing Suite

\$59 / mo

Cloud Deployment Manager

\$69 / mo

Security Audit Toolkit

\$89 / mo

OUR PRODUCTS

Dynamic product list

Use the buttons below to add or remove products from the list. The page updates instantly — no reload required.

+ Add Item
– Remove Item
1 item

 Automated Testing Suite \$59 / mo

Explanation:

A simple HTML list is used to display product items on the webpage. JavaScript is used to dynamically add a new item when the “Add” button is clicked and remove the last item when the “Remove” button is clicked. The list updates instantly without refreshing the page, making the page interactive.

Task 5: Modal Popup for User Notifications

Task Description

- Use AI to help generate:
 - o HTML structure for a modal popup
 - o CSS styling with a semi-transparent background overlay
 - o JavaScript to open and close the modal
- Include multiple ways to close the modal (button or overlay click).

Prompt:

Requirements:

1. HTML:

- Create a button called "Open Notification".
- Create the HTML structure for a modal popup containing:
 - A title
 - A short message
 - A close button.

2. CSS:

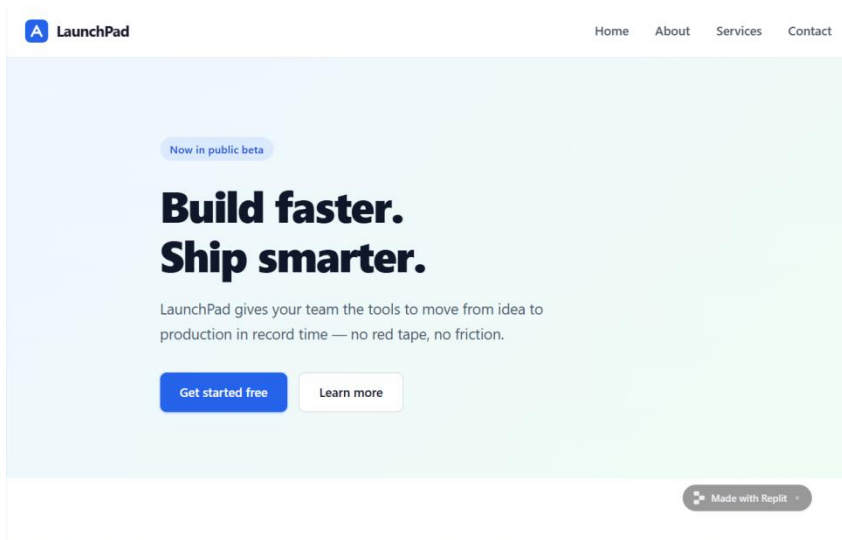

- Style the modal so it appears in the center of the screen.
- Add a semi-transparent background overlay behind the modal.
- Make the modal look clean and simple.

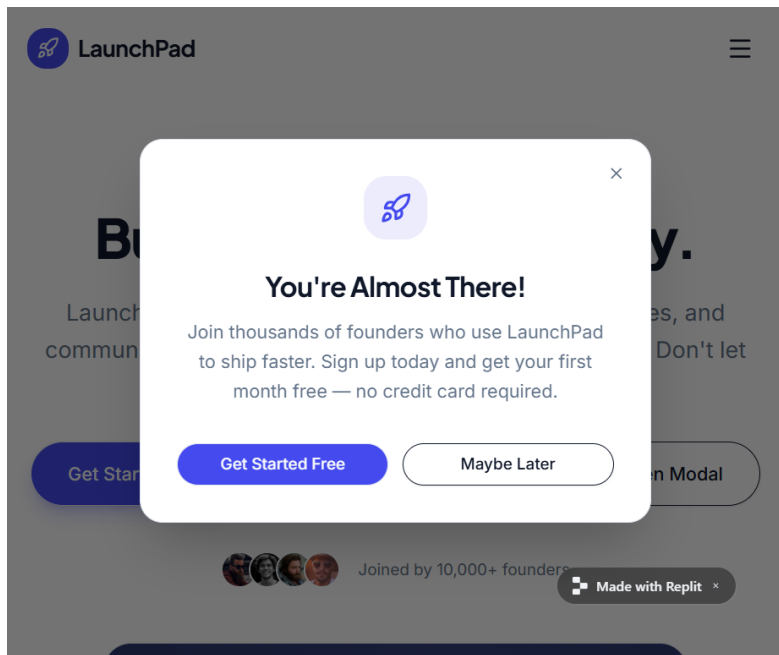

3. JavaScript:

- When the "Open Notification" button is clicked, the modal should appear.
- Allow the modal to close in multiple ways:
 - a) Clicking the close button
 - b) Clicking outside the modal on the overlay

4. Write the JavaScript in a simple way and include comments explaining ↓ Scroll to latest

Output:

Explanation:

This project creates a modal popup notification using HTML, CSS, and JavaScript. When the “Open Modal” button is clicked, a popup appears over the page with a semi-transparent background. The modal can be closed by clicking the close button or the overlay. All actions happen without reloading the webpage.
